## Pre Implementation • Go-Live • Deployment Optimization

As a leader in delivering mobile enterprise solutions, Motion Mobility Solutions combines clinical practice and healthcare business operations expertise with technology and mobile device know-how to provision high impact services. Services range from clinical workflow process modeling, network design and performance improvement, technology assimilation into clinical practice and a widely applied clinician usability study model to document business, safety and user experience improvements.

These offerings have been refined through hundreds of engagements with health facilities across North America. This depth of experience combined with Motion's solution offerings enable clients to achieve superior risk-adjusted returns and sustainable business process improvements through information technology investments. Our healthcare services, network & infrastructure services, mobility enabling software and device-related managed services are focused on helping hospitals and clinics realize value from mobile point of care initiatives at the edge of the network.

Motion solution frameworks are based on best practices and focused on mobile point of care applications. With multi-year cooperative engineering, development and go-to-market partnerships with the majority of clinical information system, medical device and network infrastructure vendors, Motion clients benefit from deep market expertise and extensive knowledge of healthcare mobility solutions.

Motion Mobility Solutions' consultant's average 20+ years of healthcare expertise and maintain applicable licensures, certifications and credentials relevant to mobile point of care workflow projects.

Statistically, according to HIMSS Analytics, the vast majority of large scale clinical information system implementation projects fail to achieve the projected benefits used at time of procurement to justify the capital investment while fully forty percent are never completely implemented. Conventional application implementation projects tend to focus on installation and go-live as end states.

Motion Mobility Solutions help ensure successful deployments from pre-implementation strategy formulation, to go live support and post go live optimization, while delivering superior end user experiences. This includes resolving issues associated with technology, facility, workflow, process, budget or accreditation parameters that can lead to deployment failures.
